

CROSS MOLLER

Patent Pending

● Just elevating a mechanical stopper enables the right-angle transfer in any conveyor systems, which does not even require a complicated control.

● Since the Cross Mollers are linked up with and driven by a Power Moller, conventional cross transfer devices are not required.

@ There is no need for changing the roller height of straight conveyor lines and that of 90° transfer line.

● The PMF series Aluminum frame (Type M and D) does not require any modifications and facilitates the installation of Cross Mollers and idler rollers.
